

Though local, this species can be abundant where found. About ten flower-heads collected at East Ham on the 21st August produced approximately 46 moths and 20 parasites; the galls taken on the same day yielded only four moths.

A SECOND MONMOUTHSHIRE RECORD OF *ARHOPALUS RUSTICUS* L. (COL: CERAMBYCIDAE). — Mr. A. A. Allen's recent note on the southward extension of this longicorn's distribution in Britain (*Ent. Rec.* 93: 166) prompts me to record the occurrence of a second example of this species on Aug. 27th 1980 at Usk. This insect, as did the one a year previously, came to my garden m.v. trap.

The lengths of these specimens were respectively 25 mm. and 22.5 mm. — Dr. G. A. NEIL HORTON, Plas Newydd, Usk, Gwent.
